Pipelines

Remote

- Maximizing efficiency
- Minimizing time commitment
- Managing your data
- How to ~~collect~~ data

“Routine” data collection:

- on non-hazardous samples
- at cryogenic temperatures
- on pre-cooled crystals in pucks
- at conventional wavelengths

Primary goals (data quantity **AND** quality...)

- To collect as much data as possible...
- To collect the best possible data...
- To collect the data that will enable me to:
 - Solve my structure
 - Extend the resolution of my structure
 - Show that my ligand is bound

Secondary goal (make your life easier!)

Primary goals (data quantity AND quality...)

- To collect as much data as possible...
- To collect the best possible data...
- To collect the data that will enable me to:
 - Solve my structure
 - Extend the resolution of my structure
 - Show that my ligand is bound

Secondary goal (make your life easier!)

- Try to answer these questions during your beamtime:
 - Can I solve my structure?
 - Can I extend the resolution of my structure?
 - Is my ligand bound?
- Make best use of time and minimise the amount of follow-up work...

How many samples to prepare per project...

Effort before,
during and
after beamtime

Time available
for other
projects/users

Number of crystals

Likelihood of
'success' within
a single visit

Number of crystals

Data collection is always a compromise...

*How much
data do I
need?*

*What
resolution
do I need?*

*What are
the data
for?*

*How much
time do I
have?*

*How many
crystals do
I have?*

Be prepared!

Think about this **before** your beamtime!

Detector types

Film

Image plate

CCD (charge-coupled device)

newest detectors at Diamond
can collect at 500 Hz:
360° possible in 10 s!
(3,600 x 0.1° images)

HPC (hybrid
photon counting)

hours

readout time

1 ms

1990

2000

2010

MX data collection has become faster...

20th century data collection

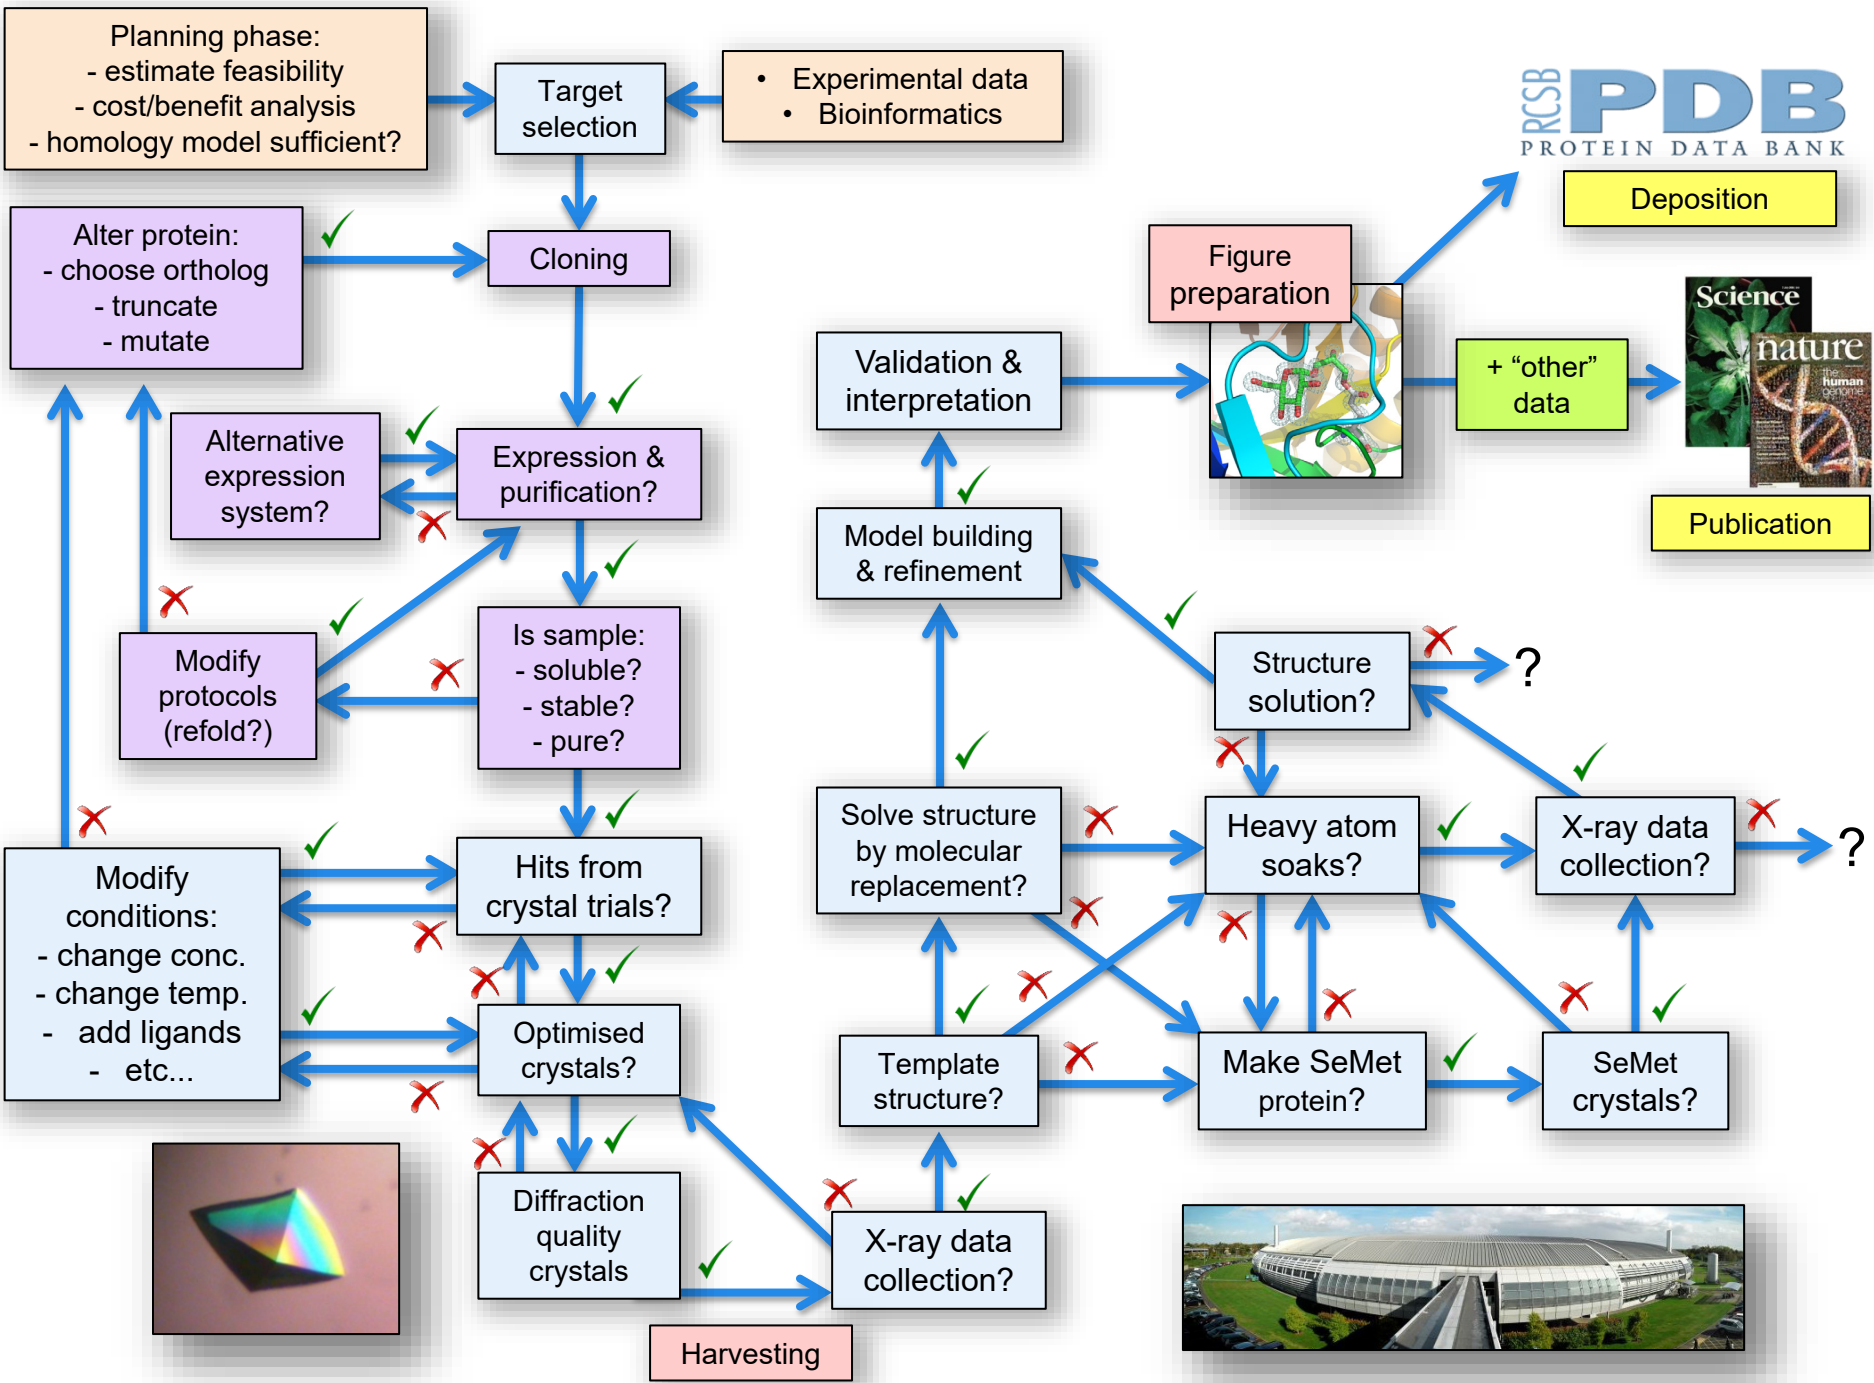

21st century data collection

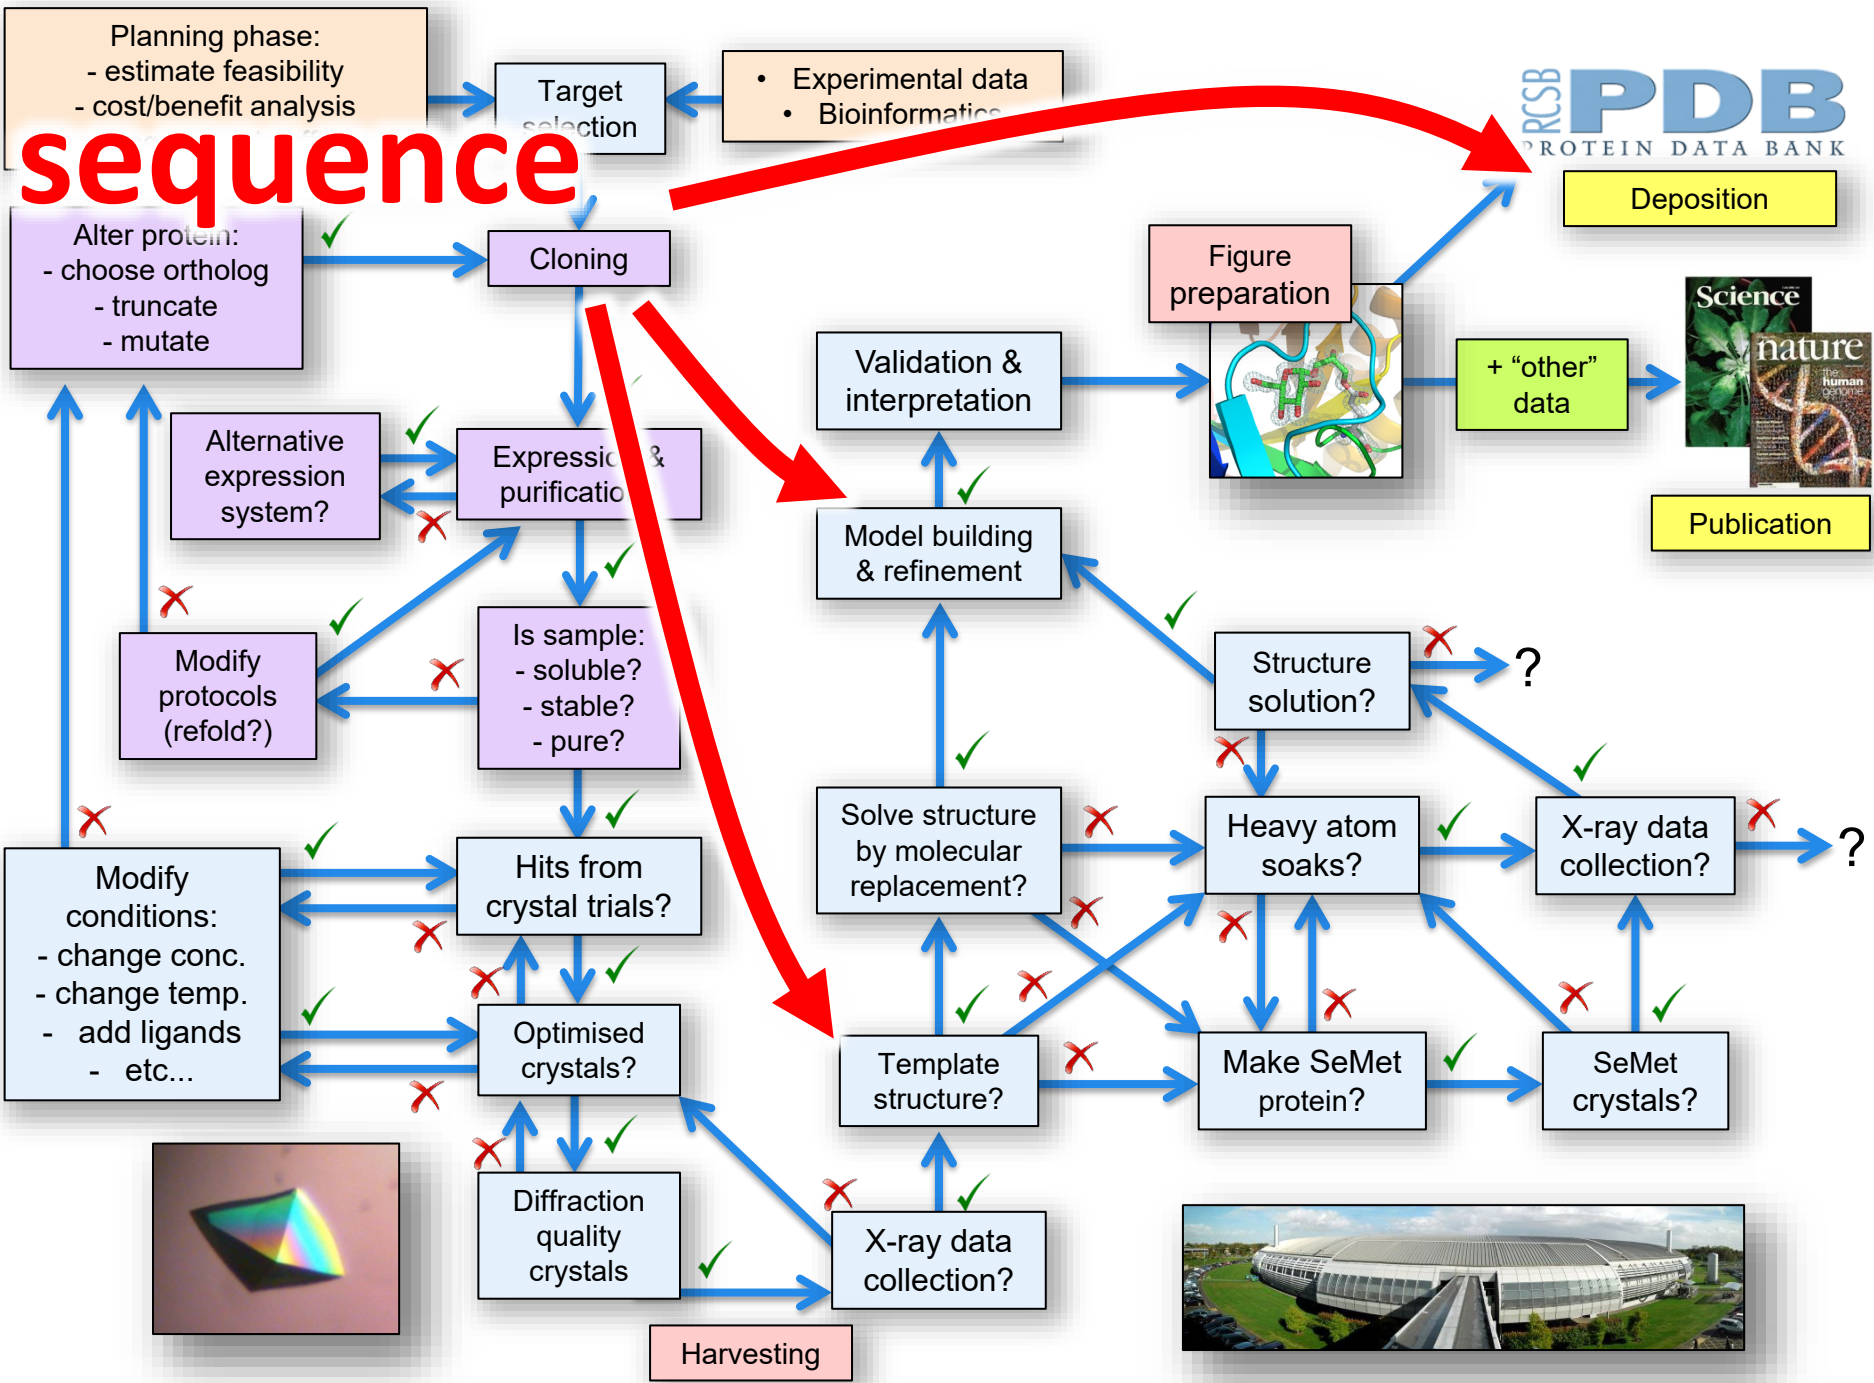

MX data collection has become much faster...

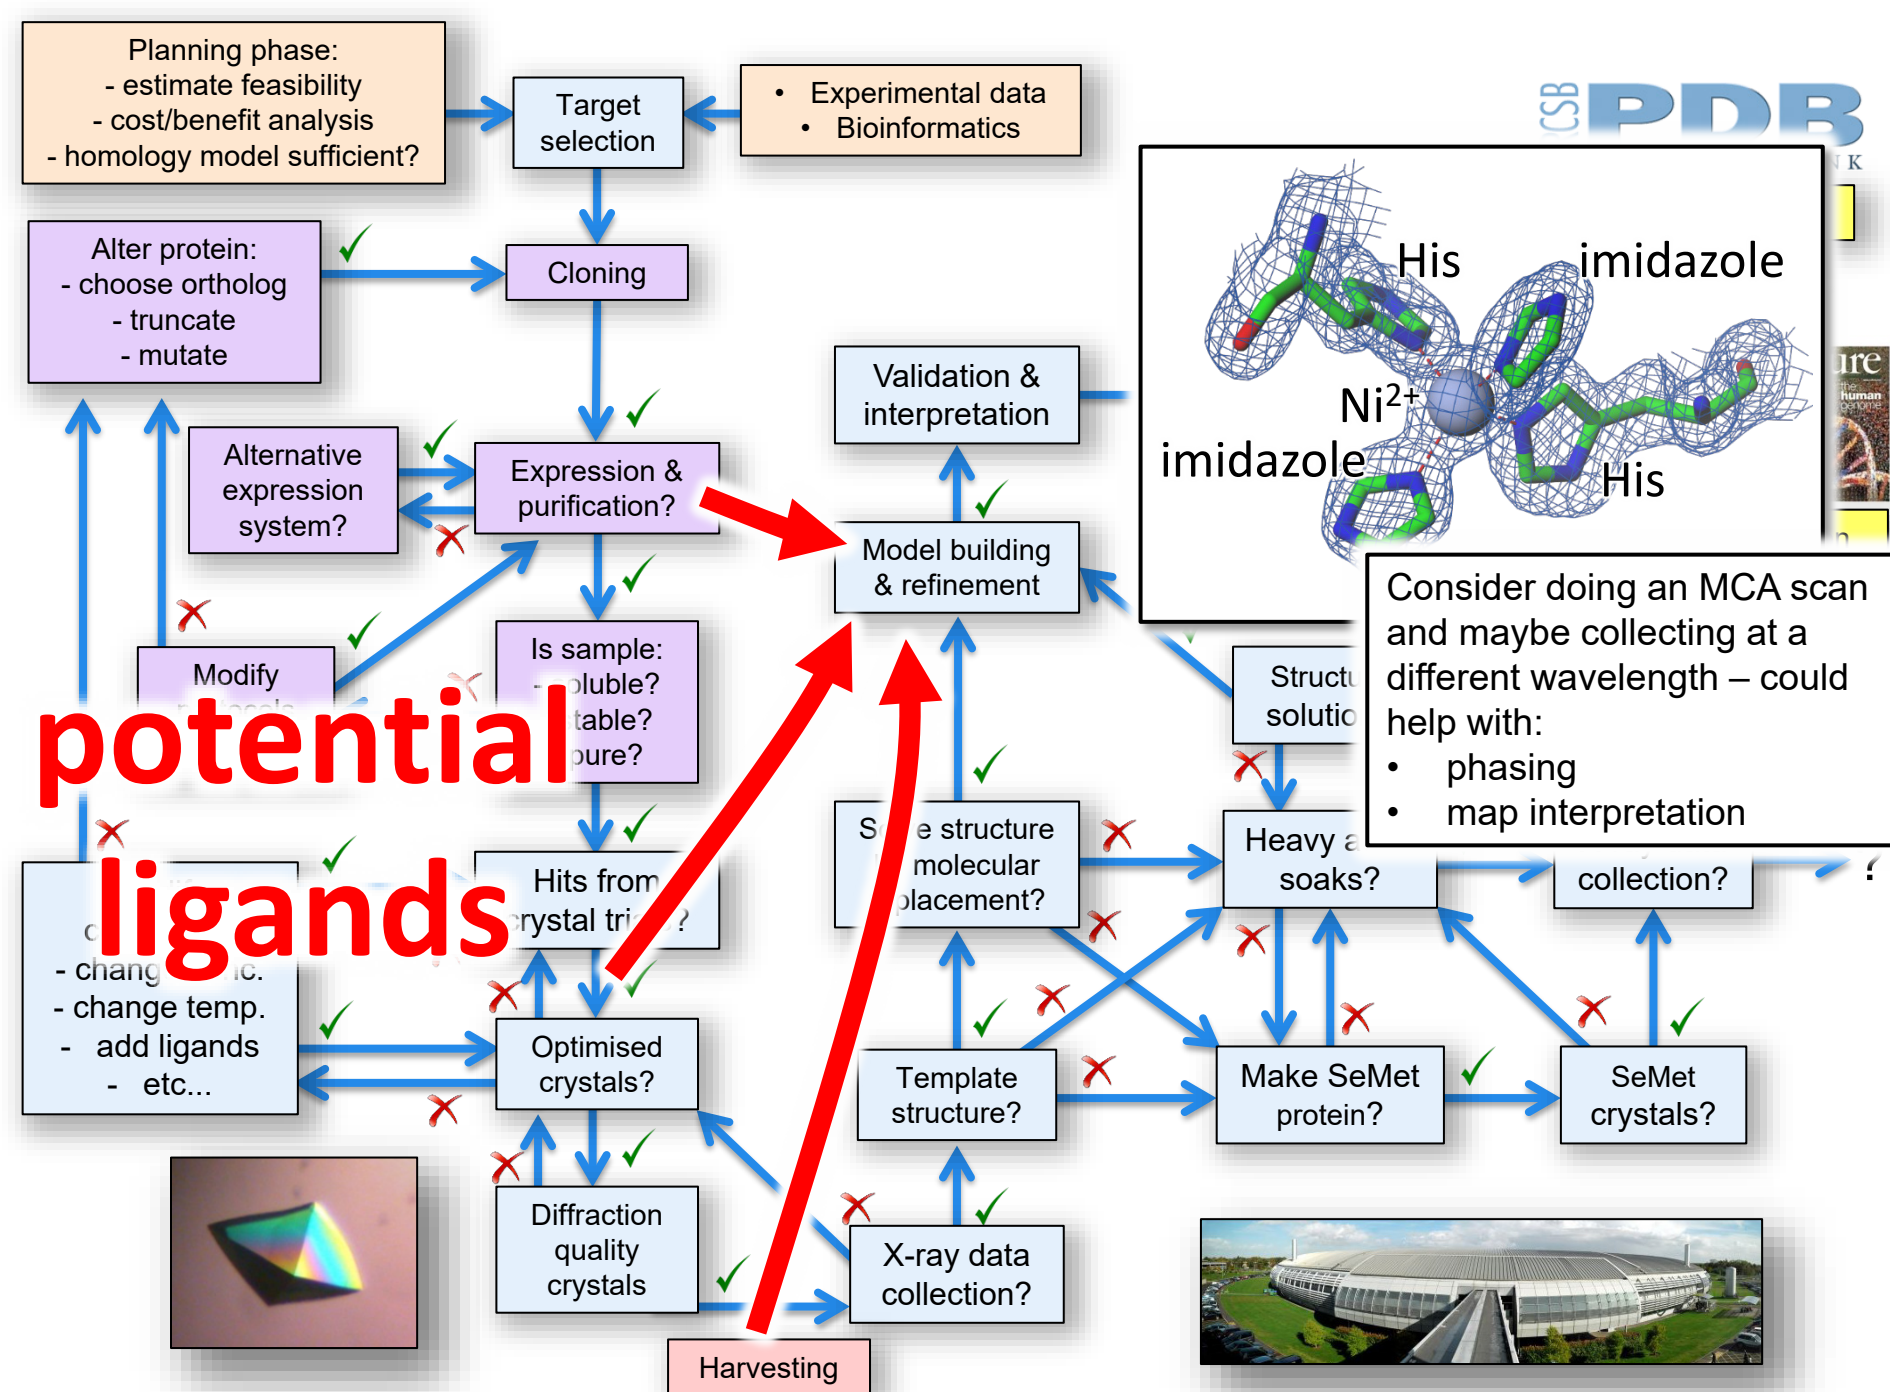

- In principle, could collect one dataset every 5 mins
(mounting + evaluating test images + collection)
- In practice, 4 “useful” data sets per hour is good
 - includes screening for “best” crystal
 - ...and thinking!
- But - beamtime is still in high demand
 - users are generating crystals more rapidly
 - can get away with “marginal” samples
- Each session is often split between several groups
 - therefore need to be efficient and organised...

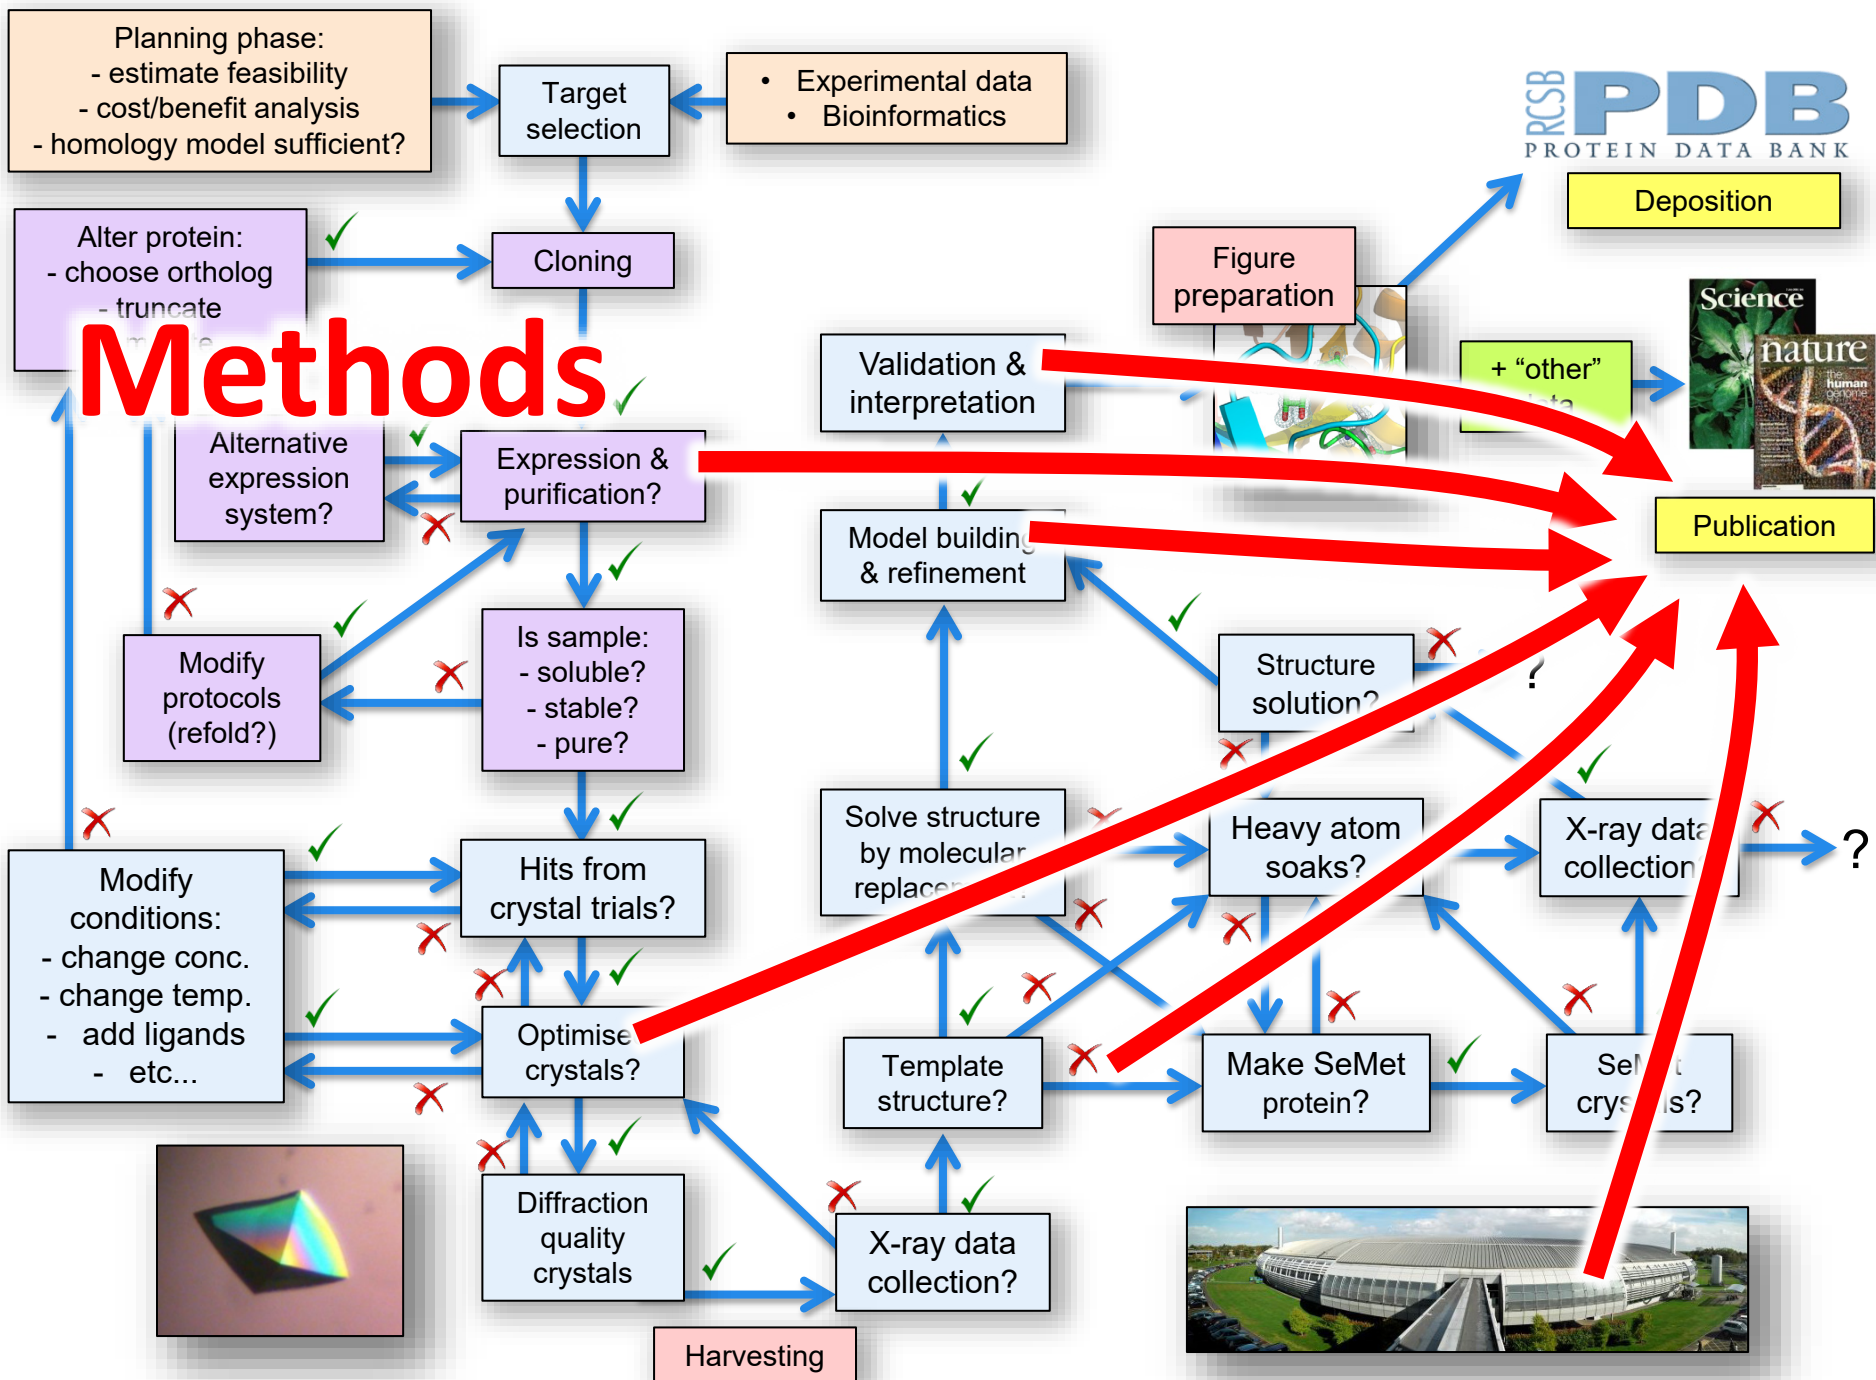

“Take back control”

Data collection setup in GDA

Select required sample from drop-down menu:

- no need to enter sample information or specify sample location
- less likely to get the wrong sample

Put your data into your own directory....

...especially important if there are multiple users from several institutions – simplifies backing up too....

Ideal scenario during session:

- Load first sample
- Collect test images
- Based on these, decide:
 - to collect...
 - not to collect...
 - to revisit later...
- For a “suitable” sample:
 - devise a data collection strategy
 - collect data set
- Analyse data as they are collected
- Based on this analysis, revise plans if appropriate
- Move onto next sample...

– not practical
without automation

Checking the results...

Checking the results...

Ideal scenario after session:

- Each data set characterised as:
 - useful/may be useful/not useful
- Some datasets processed to your satisfaction
- You may have interpretable experimental maps
- You may have preliminary structures
- You **will** have less follow-up work to do!

What to do with all the data...

Raw data (images)

- removed from disk after 30 days – still available through TopCAT (tape archive)

“Meta” data – all the other “stuff” – removed from disk after 30 days – not backed up

>90% of useful datasets derived from **Meta data** rather than going back to **Raw data**

...just be thankful it's not cryo-EM!

Getting your data home...

- FTP data home (use an App or a script)

Quite slow...

Faster...

In the meantime:

- use autoprocessing output or...
- (re)process data remotely on DLS computers and FTP output only
- copy and archive raw data later

Retain ISPyB name in CCP4i2...

CCP4i2

Create a separate
“project” for
each dataset

If you have more than one dataset for a given protein – create a separate “dummy project” and group the “dataset projects” under this:

Create a New Project

Name of project/folder: NmADH9_23_1

By default all projects go in the 'CCP4I2_PROJECTS' directory in your home area - click 'Select directory' to choose an alternative.
Hint to organise your projects: in the 'Manage projects' window you can use a project as a folder and drag other projects into it

Description of project: High res data from binary complex with NAD

Choose tag.. Choose tag.. Choose tag..

Rename project

Edit description

*but directory names remain the same

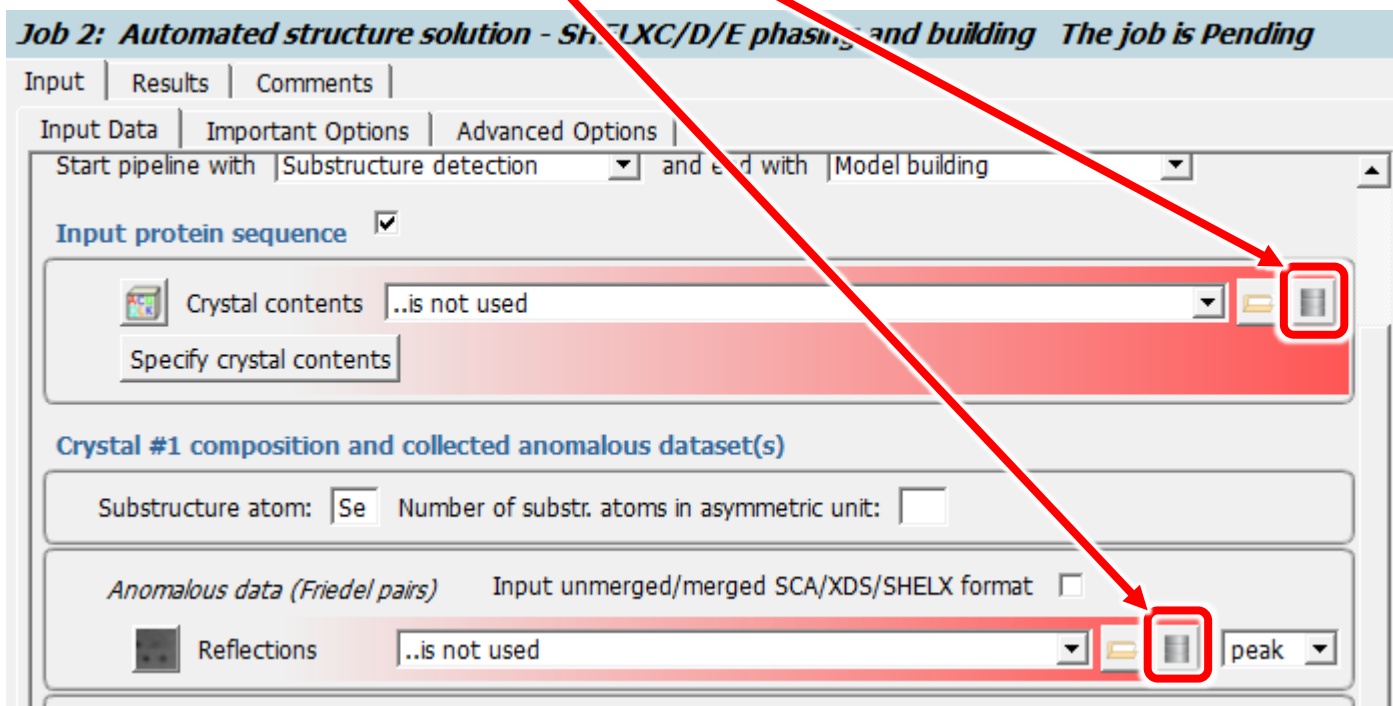

CCP4i2

Could create “non-dataset projects” for specific activities such as phasing...

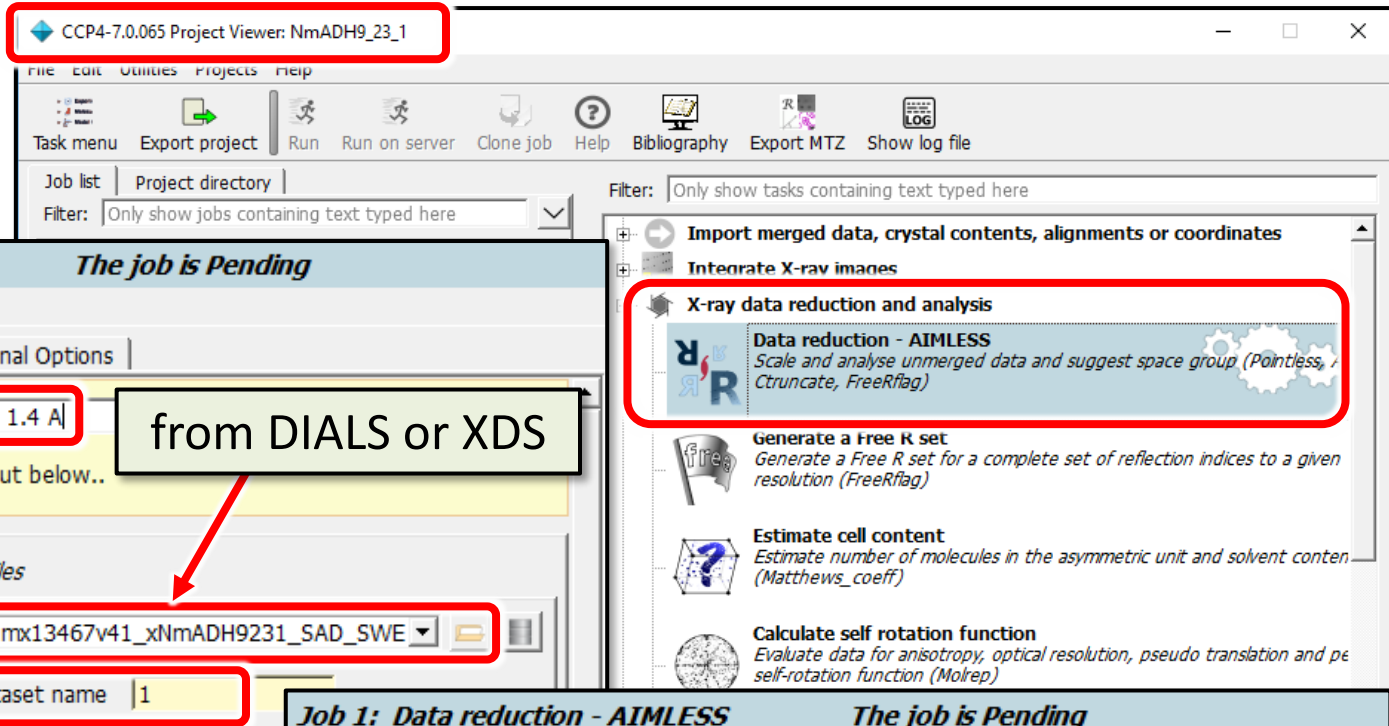

...then borrow files from other projects...

My preferred option for processing...

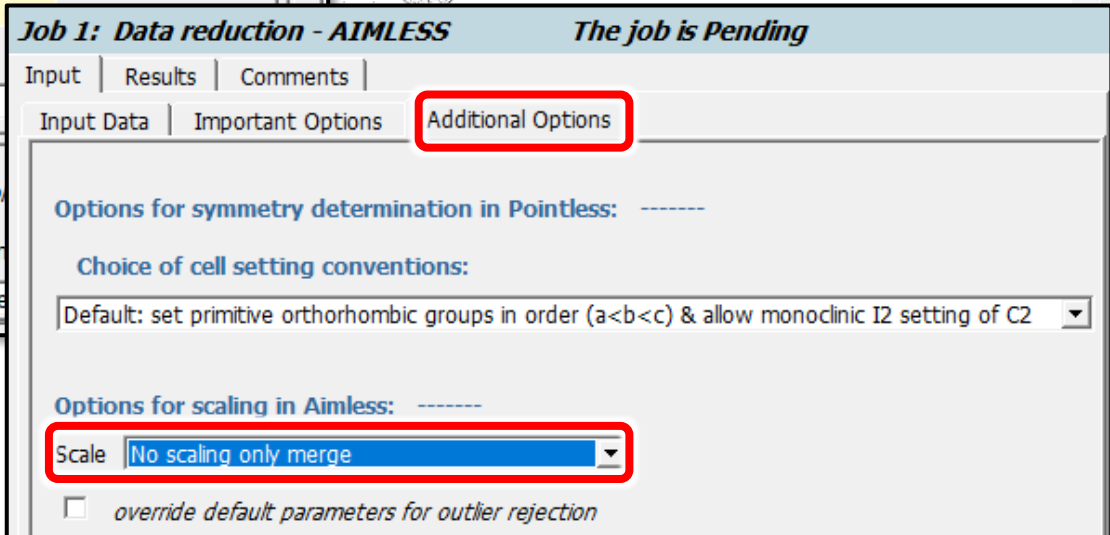

- where the pipelines have done a good job – take part-processed dataset (from the “Meta” data) and re-run the merging step in CCP4i2

use informative
job titles

from DIALS or XDS

may want to change
resolution, exclude
images etc...

Gives lots of output – useful for troubleshooting...

for your
paper/thesis

all the important data processing statistics
are now in your CCP4i2 project database

...or reprocess from scratch using the Dials User Interface

Integrate images with Dials
Launch DUI and capture output

see DIALS talk...

Summary - why use ISPyB & pipelines?

- Faster sample changing (select by ISPyB name)
 - essential for remote...
- Informs the decision making process
 - make decisions sooner
 - revise strategy on the fly
 - (e.g. recollect dataset x... no more data required for project y...)
 - make better overall use of beamtime
- Reduces amount of post-beamtime follow-up work
- Simple to keep track of your samples and data

Remote data collection

it's 2021...
remote data collection?
it's a no-brainer!

not going to cover unattended data collection (UDC)...

On-site data collection can be a big time commitment...

Remote data collection saves you time...

...and is covid-secure

...and the planet

For routine data collection at 100 K:

- Samples prepared and cryo-cooled in home lab
- Sample information entered into ISPyB database
- Transported to Diamond in dry shipping dewars
- Samples mounted robotically
- Data collection controlled through GDA interface
- Only manual operation at DLS: loading/unloading pucks
 - Up to 592 samples can be loaded at once
- Everything else computer driven...

Therefore you don't need to be there!

What is remote data collection?

home lab/home

Remote data collection

...in 2021

...from here

Remote data collection 2021 style!

iMac connected to
beamline computer
via NX client

PC connected to PC
at work via VPN

share screen
with others

Timeline for fully remote data collection

Sometime prior to shift:

- LC loads pucks into beamline dewar and enters puck positions into ISPyB database

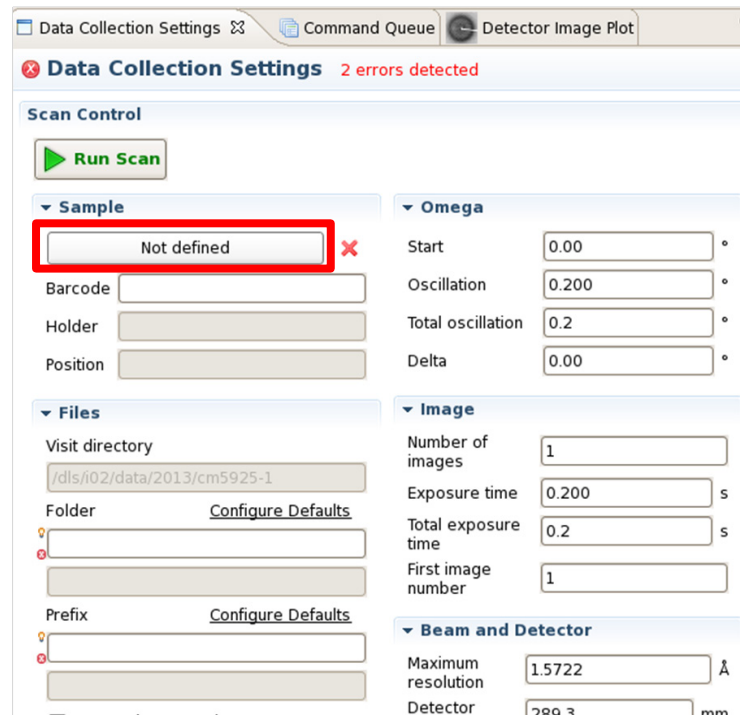

Shortly before start of shift (or slot in running order):

- connect to beamline computer using NX client
- start GDA

Zero hour:

- take the baton, select sample from menu, collect data!

When things go wrong...

Can you fix things?

- probably not!

On-site user:

- During normal working hours – call local contact
- Out of hours – call EHC

Remote user:

- During normal working hours – call local contact
- Out of hours – call EHC

Therefore you don't need to be there!

Check the webcams!

Sun Nov 25 15:25:45 - I04 Sample Position

Sun Nov 25 15:25:45 - I04 Sample Ch

If you suspect a problem – call the EHC!

If you see no diffraction – 3 main causes:

(1) there is a problem (any number of things...)

(2) you are doing something wrong/stupid

(3) your sample is rubbish!

Pop a couple of test crystals into one of your pucks (something you know will diffract e.g. lysozyme)

Advantages of remote data collection:

- Beamtime is fully used
- Users collect data on their own crystals
- Users stay at home labs (or at home)
 - time commitment is low for remote users
 - your boss/collaborator can observe data collection
 - useful for training non-experts
- Time can be used flexibly
- Less stressful
- Difficult to “break” the beamline

Are there any disadvantages of remote data collection?

- miss the “wow factor” of being at a synchrotron
- lose face-to-face interactions with Diamond staff
 - do BAG training
 - go to User meeting
 - get in touch online

Take home messages

- make full use of ISPyB (use ISPyB name!)
- exploit the MX software tools/pipelines
- use remote data collection for routine experiments
- think before and during data collection
- this is your last experiment – don't mess it up!

Acknowledgements

- Access to MX beamlines at Diamond
- Excellent support from:
 - Beamline staff
 - EHC/Control Room staff
 - User Office
- Software developers
- BBSRC
